current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is not the entire insert of clone Y53C12D. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (02-NOV-1998) Nematode Sequencing Project, Sanger Centre,

Coding NOTES: gene gene CDS FEATURES Department of Genetics, Washington University, St. Louis, MO 63110, USA, and Sanger Centre, Hinxton Hall Cambridge CBlO IRQ, England e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

## NEIGHBORING COSMID INFORMATION:

ďq The 5' clone is T03G11, 4800 bp overlap;3' clone is Y34B4A, 6600 overlap. Actual start of this clone is at base position 78 of CELH28G03; actual end is at 37952 of CELH28G03

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one m13 subclone.

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between

neighboring submissions.

complement(21324, .22960)

CDS

```
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced numbiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (17-DEC-1998) Nematode Sequencing Project, Sanger Centr Hinxton, Cambridge CB10 1RO, England and Department of Genetics, Mashington University, St. Louis, MO 63110, USA. Submitted (07-SEP-1999) Nematode Sequencing Project, Sanger Centre, Hinxton, Cambridge CB10 1R0, UK and Department of Genetics, Washington University, St. Louis, WO 63110, USA. E-mail: hes@sanger.ac.uk or rwenematode.wustl.edu on Nov 21, 1998 this sequence version replaced g1:3873430. IMPORTMANT: This sequence version replaced g1:3873430. IMPORTMANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the contaminated with foreign sequence from E.coli, yeast, vector, or the sequence may be contaminated with foreign sequence from E.coli, yeast, vector,

Eukaryota; Metazoa; Nematoda; Chromadorea; Rhabditida; Rhabditoidea; Rhabditidae; Peloderinae; Caenorhabditis. 1 (bases 1 to 247332) Harris, B.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access meaning. (RAM), read-only memory (ROM) or CD-ROM Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are ILKely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The collypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin sydarome, toxic shock contained the composition are useful as primers or probes for isolating committer readable mackin...

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 936 BP; 4 A; 139 C; 10 G; 7 T; 776 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 6; Page 127; 159pp; English.
                                                                                                                                                                                                                                                                                                                                                                 (CLIN-) CLINICAL MICRO SENSORS INC.

                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ttactgatatattagcgaaaagtgcaaatgcacaagtagttatgatttgtggtaagagca 724
                                                                                                 acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                 64

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                              The present invention relates to a composition comprising two nuclei acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            65 ttacacagagtatcgttaatcaacttaatgatatgaatctagaccatttaagcgtcattg 124
                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5 ttactcaaaataaaaagatattgattattactggctcattcggtaacggtcatatgcaag 64

```
The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-incleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                184

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ttacacagagtatcgttaatcaacttaatgatatgaatctagaccatttaagcgtcattg 124
                                                                                                                                                                                                                                                                                                                                                                                                         different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nuclectide polymorphisms, e.g. for genotyping, monitoring gene expression.

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            имичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимичентимиче
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     425 actggattacgccgtattcaacaagatattatgtggcaacaaaagaaacgaaacaagact 484

This invention describes a novel protein (I) comprising identical or different catalytic domains of glycosyl transferases and which has processive activity (i.e. builds up oliopsaccharide glycolipids by successive addition of glucose units). (I) can be used to produce 3-olioglucosyl-1,2-diacylglycerols useful as food emulsifiers, polymer modifiers or detergents. This sequence encodes a Bacilius subtilis glycosyl transferase catalytic domain which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Catalytic domain; glycosyl transferase; processive activity; detergent; oligosaccharide glycolipid; 3-oligoglucosyl-1,2-diacylglycerol; food emulsifier; polymer modifier; glycosyl transferase; ss.
